School Connectedness

What does the evidence say?

October 2014

Why Should We Care about School Connectedness?

The presence of caring relationships in schools — the heart of school connectedness — is increasingly recognized as a vital component of successful schools. The research is strong and consistent; students who feel connected to school do better academically and are healthier.

Impact on Learning

- Research has found correlations between school connectedness and four academic outcomes: attendance, dropout rates, self-reported grades and perceived academic competence. (McNeely, 2013) (Centers for Disease Control and Prevention, 2011) (Blum, 2005) (Monahan, 2010).
- When students feel supported by adults at school, they feel more motivated to engage in class, do their homework, and are more likely to value school. (McNeely, 2013), (Blum, 2005).
- The BC Adolescent Health Surveys (2008 and 2013) confirmed that students who report higher school connectedness are more likely to expect to continue their education beyond high school (Smith A. S., 2014), (Smith, Poon, Stewart, Hoogeveen, Saewyc, & the McCreary Centre Society, 2011).

School Connectedness is about creating a school community where everyone feels safe, seen, heard, supported, significant, and cared for.
- BC School Centred Mental Health Coalition

Impact on Health and Wellbeing

- A recent UBC study found that, for 4th grade students in Vancouver, school support was more important than family support as a predictor of their emotional wellbeing (Oberle, Schonert-Reichl, Guhn, Zumbo, & Hertzman, 2014).
- The more connected youth feel to school, the more likely they are to report good or excellent health as well as higher self-esteem, and the less likely they are to have considered suicide (Smith, Poon, Stewart, Hoogeveen, Saewyc, & the McCreary Centre Society, 2011).Students who feel connected to school report fewer depressive symptoms in late adolescence (Monahan, 2010), (Rasic, Langille, Kisely, Flowerdew, & Cobbett, 2012)(McKay, 2009). For females in nearly every vulnerable group, school connectedness is an even stronger protective factor than family connectedness for good or excellent health (Smith, Poon, Stewart, Hoogeveen, Saewyc, & the McCreary Centre Society, 2011).
- There is strong evidence that students who feel connected to school are less likely to exhibit:
    - disruptive behavior (Monahan, 2010) (Loukas, Roalson, & Herrera, 2010);
    - violence (Centers for Disease Control and Prevention, 2011);
    - substance and tobacco use (Centers for Disease Control and Prevention, 2011);
    - emotional distress (Monahan, 2010), (McKay, 2009);
    - early sexual initiation (Blum, 2005), (Centers for Disease Control and Prevention, 2011).

Next to family nurturing, school connectedness is the most important protective factor in a young person's life.
- Dan Reist, Centre for Addictions Research of BC

- The impact of school connectedness can be long lasting. Longitudinal studies have provided strong evidence that school connectedness can have a positive effect reaching into young adulthood, resulting in lower rates of substance use, better mental health and higher school completion rates (Monahan, 2010).
- School connectedness is also a protective factor for early adolescent conduct problems, and has been found to compensate for poor quality family relationships (Loukas, Roalson, & Herrera, 2010).
